Stereotypes in media coverage

What's Automated Content Analysis?

Methodological approach

	Counting and Dictionary	Supervised Machine Learning	Unsupervised Machine Learning
Typical research interests and content features	visibility analysis sentiment analysis subjectivity analysis	frames topics gender bias	frames topics
Common statistical procedures	string comparisons counting	support vector machines naive Bayes	principal component analysis cluster analysis latent dirichlet allocation semantic network analysis
	deductive		inductive

Boumans, J. W., & Trilling, D. (2016). Taking stock of the toolkit: An overview of relevant autmated content analysis approaches and techniques for digital journalism scholars. *Digital Journalism*, 4(1), 8–23. doi:10.1080/21670811.2015.1096598

Regular expressions

Basic ACA: Dictionary- and string-based methods Regular expressions

Regular Expressions: What and why?

What is a regexp?

• a very widespread way to describe patterns in strings

Regular Expressions: What and why?

What is a regexp?

- a very widespread way to describe patterns in strings
- Think of wildcards like * or operators like OR, AND or NOT in search strings: a regexp does the same, but is much more powerful

Regular Expressions: What and why?

What is a regexp?

- a very widespread way to describe patterns in strings
- Think of wildcards like * or operators like OR, AND or NOT in search strings: a regexp does the same, but is much more powerful
- You can use them in many text editors (!), in STATA, R, Python, ...

An example

We wanted to find references to companies in several years of news coverage

Problems:

- Spelling variations (ABN, ABN Amro, ABN-Amro, ...)
- Shouldn't be in the middle of the word, but can be at the beginning of a word, optionally connected with a hyphen ("ABN-topman", "Shellstation")

For instance, \bING(?:-.*?)?\b allows to specify exactly this.

Strycharz, J., Strauss, N., & Trilling, D. (2017). The role of media coverage in explaining stock market fluctuations: insights for strategic financial communication. *International Journal of Strategic Communication, online first*. doi:10.1080/1553118X.2017.1378220

Jonkman, J. G., Trilling, D., Verhoeven, P., & Vliegenthart, R. (2016). More or less diverse: An assessment of the effect of attention to media salient company types on media agenda diversity in Dutch newspaper coverage between 2007 and 2013. Journalism, online first. doi:10.1177/146488491668037

Basic regexp elements

Alternatives

[TtFf] matches either T or t or F or f

Twitter | Facebook matches either Twitter or Facebook

. matches any character

Basic regexp elements

Alternatives

[TtFf] matches either T or t or F or f

Twitter | Facebook matches either Twitter or Facebook

. matches any character

Repetition

- * the expression before occurs 0 or more times
- + the expression before occurs 1 or more times

regexp quizz

Which words would be matched?

1 [Pp]ython

regexp quizz

Which words would be matched?

- 1 [Pp]ython

regexp quizz

Which words would be matched?

- 1 [Pp]ython
- **2** [A-Z]+
- **3** RT :* @[a-zA-Z0-9]*

What else is possible?

If you google regexp or regular expression, you'll get a bunch of useful overviews. The wikipedia page is not too bad, either.

Possible applications

Data preprocessing

- Remove unwanted characters, words, ...
- Identify *meaningful* bits of text: usernames, headlines, where an article starts, . . .
- filter (distinguish relevant from irrelevant cases)

Possible applications

Data analysis: Automated coding

- Actors
- Brands
- links or other markers that follow a regular pattern
- Numbers (!)

Unsupervised Machine Learning

Methodological approach

	Counting and Dictionary	Supervised Machine Learning	Unsupervised Machine Learning
Typical research interests and content features	visibility analysis sentiment analysis subjectivity analysis	frames topics gender bias	frames topics
Common statistical procedures	string comparisons counting	support vector machines naive Bayes	principal component analysis cluster analysis latent dirichlet allocation semantic network analysis
	deductive		inductive

Boumans, J. W., & Trilling, D. (2016). Taking stock of the toolkit: An overview of relevant autmated content analysis approaches and techniques for digital journalism scholars. *Digital Journalism*, *4*(1), 8–23. doi:10.1080/21670811.2015.1096598

Unsupervised

- No manually coded data
- We want to identify patterns or to make groups of most similar cases

Unsupervised

- No manually coded data
- We want to identify patterns or to make groups of most similar cases

Example: We have a dataset of Facebook-massages on an organizations' page. We use clustering to group them and later interpret these clusters (e.g., as complaints, questions, praise, ...)

Unsupervised

- No manually coded data
- We want to identify patterns or to make groups of most similar cases

Example: We have a dataset of Facebook-massages on an organizations' page. We use clustering to group them and later interpret these clusters (e.g., as complaints, questions, praise, . . .)

Supervised

- We code a small dataset by hand and use it to "train" a machine
- The machine codes the rest

Unsupervised

- No manually coded data
- We want to identify patterns or to make groups of most similar cases

Example: We have a dataset of Facebook-massages on an organizations' page. We use clustering to group them and later interpret these clusters (e.g., as complaints, questions, praise, ...)

Supervised

- We code a small dataset by hand and use it to "train" a machine
- The machine codes the rest

Example: We have 2,000 of these messages grouped into such categories by human coders. We then use this data to group all remaining messages as well

inductive and bottom-up: unsupervised machine learning

inductive and bottom-up: unsupervised machine learning

(something you aready did in your Bachelor - no kidding.)

Principal Component Analysis? How does that fit in here?

Principal Component Analysis? How does that fit in here?

In fact, PCA is used everywhere, even in image compression

Principal Component Analysis? How does that fit in here?

PCA in ACA

- Find out what word cooccur (inductive frame analysis)
- Basically, transform each document in a vector of word frequencies and do a PCA

A so-called term-document-matrix

A so-called term-document-matrix

PCA

```
1 w1,w2,w3,w4,w5,w6 ...

2 text1, 2, 0, 0, 1, 2, 3 ...

3 text2, 0, 0, 1, 2, 3, 4 ...

4 text3, 9, 0, 1, 1, 0, 0 ...

5 ...
```

These can be simple counts, but also more advanced metrics, like tf-idf scores (where you weigh the frequency by the number of documents in which it occurs), cosine distances, etc.

PCA: implications and problems

- given a term-document matrix, easy to do with any tool
- probably extremely skewed distributions
- some problematic assumptions: does the goal of PCA, to find a solution in which one word loads on one component match real life, where a word can belong to several topics or frames?

Enter topic modeling with Latent Dirichlet Allocation (LDA)

LDA, what's that?

LDA

No mathematical details here, but the general idea

- There are k topics, $T_1 \dots T_k$
- Each document D_i consists of a mixture of these topics, e.g. $80\% T_1, 15\% T_2, 0\% T_3, \dots 5\% T_k$
- On the next level, each topic consists of a specific probability distribution of words
- Thus, based on the frequencies of words in D_i, one can infer its distribution of topics
- Note that LDA (like PCA) is a Bag-of-Words (BOW) approach

Doing a LDA in Python

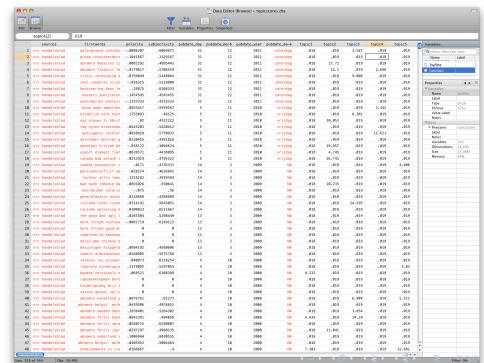

You can use gensim (Řehůřek & Sojka, 2010) for this.

Řehůřek, R., & Sojka, P. (2010). Software framework for topic modelling with large corpora. Proceedings of the LREC 2010 Workshop on New Challenges for NLP Frameworks, pp. 45-50, Valletta, Malta: ELRA,

```
from gensim import corpora, models
1
2
    NTOPICS = 100
3
    LDAOUTPUTFILE="topicscores.tsv"
5
    # Create a BOW represenation of the texts
6
    id2word = corpora.Dictionary(texts)
7
    mm =[id2word.doc2bow(text) for text in texts]
8
9
    # Train the LDA models.
10
11
    lda = models.ldamodel.LdaModel(corpus=mm, id2word=id2word, num topics=
        NTOPICS)
12
    # Print the topics.
13
14
    for top in lda.print_topics(num_topics=NTOPICS, num_words=5):
       print ("\n",top)
15
16
17
    # save topic scores
    scoresperdoc=lda.inference(mm)
18
    with open(LDAOUTPUTFILE, "w", encoding="utf-8") as fo:
19
     for row in scoresperdoc[0]:
20
       fo.write("\t".join(["{:0.3f}".format(score) for score in row]))
21
       fo.write("\n")
22
```

Output: Topics (below) & topic scores (next slide)

```

Boumans, J. W., & Trilling, D. (2016). Taking stock of the toolkit: An overview of relevant autmated content analysis approaches and techniques for digital journalism scholars. *Digital Journalism*, 4(1), 8–23. doi:10.1080/21670811.2015.1096598

You have done it before!

Regression

Regression

1 Based on your data, you estimate some regression equation $y_i = \alpha + \beta_1 x_{i1} + \cdots + \beta_p x_{ip} + \varepsilon_i$

Regression

- **1** Based on your data, you estimate some regression equation $y_i = \alpha + \beta_1 x_{i1} + \cdots + \beta_p x_{ip} + \varepsilon_i$
- **2** Even if you have some *new unseen data*, you can estimate your expected outcome \hat{y} !

Regression

- **1** Based on your data, you estimate some regression equation $y_i = \alpha + \beta_1 x_{i1} + \cdots + \beta_p x_{ip} + \varepsilon_i$
- **2** Even if you have some *new unseen data*, you can estimate your expected outcome \hat{y} !
- Sexample: You estimated a regression equation where y is newspaper reading in days/week:

$$y = -.8 + .4 \times man + .08 \times age$$

Regression

- **1** Based on your data, you estimate some regression equation $y_i = \alpha + \beta_1 x_{i1} + \cdots + \beta_p x_{ip} + \varepsilon_i$
- **2** Even if you have some *new unseen data*, you can estimate your expected outcome \hat{y} !

$$y = -.8 + .4 \times man + .08 \times age$$

You could now calculate ŷ for a man of 20 years and a woman of 40 years – even if no such person exists in your dataset:

$$\hat{y}_{man20} = -.8 + .4 \times 1 + .08 \times 20 = 1.2$$

$$\hat{y}_{woman40} = -.8 + .4 \times 0 + .08 \times 40 = 2.4$$

This is Supervised Machine Learning!

 We will only use half (or another fraction) of our data to estimate the model, so that we can use the other half to check if our predictions match the manual coding ("labeled data", "annotated data" in SML-lingo)

- We will only use half (or another fraction) of our data to estimate the model, so that we can use the other half to check if our predictions match the manual coding ("labeled data", "annotated data" in SML-lingo)
 - e.g., 2000 labeled cases, 1000 for training, 1000 for testing if successful, run on 100,000 unlabeled cases

- We will only use half (or another fraction) of our data to estimate the model, so that we can use the other half to check if our predictions match the manual coding ("labeled data", "annotated data" in SML-lingo)
 - e.g., 2000 labeled cases, 1000 for training, 1000 for testing if successful, run on 100,000 unlabeled cases
- We use many more independent variables ("features")

- We will only use half (or another fraction) of our data to estimate the model, so that we can use the other half to check if our predictions match the manual coding ("labeled data", "annotated data" in SML-lingo)
 - e.g., 2000 labeled cases, 1000 for training, 1000 for testing if successful, run on 100,000 unlabeled cases
- We use many more independent variables ("features")
- Typically, IVs are word frequencies (often weighted, e.g. tf×idf) (⇒BOW-representation)

Applications

Applications

Applications

In other fields

A lot of different applications

from recognizing hand-written characters to recommendation systems

Applications

In other fields

A lot of different applications

from recognizing hand-written characters to recommendation systems

In our field

It starts to get popular to measure latent variables

- frames
- topics

SML to code frames and topics

Applications

Some work by Burscher and colleagues

- Humans can code generic frames (human-interest, economic, ...)
- Humans can code topics from a pre-defined list

Some work by Burscher and colleagues

- Humans can code generic frames (human-interest, economic, ...)
- Humans can code topics from a pre-defined list
- But it is very hard to formulate an explicit rule
 (as in: code as 'Human Interest' if regular expression R is matched)

SML to code frames and topics

Applications

Some work by Burscher and colleagues

- Humans can code generic frames (human-interest, economic, ...)
- Humans can code topics from a pre-defined list
- But it is very hard to formulate an explicit rule
 (as in: code as 'Human Interest' if regular expression R is matched)
- ⇒ This is where you need supervised machine learning!

Burscher, B., Odijk, D., Vliegenthart, R., De Rijke, M., & De Vreese, C. H. (2014). Teaching the computer to code frames in news: Comparing two supervised machine learning approaches to frame analysis. *Communication Methods and Measures, 8*(3), 190–206. doi:10.1080/19312458.2014.937527

Burscher, B., Vliegenthart, R., & De Vreese, C. H. (2015). Using supervised machine learning to code policy issues: Can classifiers generalize across contexts? *Annals of the American Academy of Political and Social Science*, 659(1), 122–131.

 $\label{eq:FIGURE 1} \textbf{FIGURE 1}$ Learning Curves for the Classification of News Articles and PQs

 ${\it TABLE~1} \\ {\it F1~Scores~for~SML-Based~Issue~Coding~in~News~Articles~and~PQs}$

Issue		News Articles		PQs	
		All Words	Lead Only		All Words
Features	N	F1	F1	N	F1
Macroeconomics	413	.54	.63	172	.46
Civil rights and minority issues	327	.34	.28	192	.53
Health	444	.70	.71	520	.81
Agriculture	114	.72	.76	159	.66
Labor and employment	217	.43	.49	174	.58
Education	188	.79	.71	229	.78
Environment	152	.34	.44	237	.59
Energy	81	.35	.59	67	.66
Immigration and integration	150	.50	.57	239	.78
Transportation	416	.58	.67	306	.81
Law and crime	1198	.70	.69	685	.77
Social welfare	115	.33	.34	214	.54
Community development and housing	113	.45	.44	136	.72
Banking, finance, and commerce	622	.62	.67	188	.58
Defense	393	.59	.55	196	.71
Science, technology, and communication	426	.64	.59	57	.53
International affairs and foreign aid	1,106	.70	.64	352	65
Government operations	1,301	.71	.72	276	.48
Other issue	3,322	.84	.80	360	.51
Total	11,089	.71	.68	4,759	.69

NOTE: The F1 score is equal to the harmonic mean of recall and precision. Recall is the fraction of relevant documents that are retrieved, and precision is the fraction of retrieved documents that are relevant.

How many selected ltems are relevant? How many relevant ltems are selected? Precision = Recall =

Some measures of accuracy

- Recall
- Precision
- $F1 = 2 \cdot \frac{\text{precision} \cdot \text{recall}}{\text{precision} + \text{recall}}$
- AUC (Area under curve)
 [0,1], 0.5 = random guessing

What does this mean for our research?

It we have 2,000 documents with manually coded frames and topics. . .

- we can use them to train a SML classifier
- which can code an unlimited number of new documents
- with an acceptable accuracy

Some easier tasks even need only 500 training documents, see Hopkins, D. J., & King, G. (2010). A method of automated nonparametric content analysis for social science. *American Journal of Political Science*, 54(1), 229–247.

- CountVectorizer (=simple word counts)
- TfidfVectorizer (word counts ("term frequency") weighted by number of documents in which the word occurs at all ("inverse document frequency"))
- additional options: stopwords, thresholds for minimum frequencies etc.

Different classifiers

- Naïve Bayes
- Logistic Regression
- Support Vector Machine (SVM)
- . . .

Typical approach: Find out which setup performs best (see example source code in the book).

Examples

Putting these techniques into practice

- Shareworthiness
- Online vs offline news

What explains how often an article is shared on social media?

Trilling, D., Tolochko, P., & Burscher, B. (2017). From Newsworthiness to Shareworthiness. *Journalism & Mass Communication Quarterly*, *94*(1), 38–60. doi:10.1177/1077699016654682

The data

- Subscribe to RSS feeds of major news outlets
- Query feeds 1x/hour for a year, follow links and download
- Parse downloads (i.e., extract title, text, . . .)
- Use Twitter and Facebook API to retrieve number of shares

The automated content analysis

- written by press agency?: regular expressions
- geographical location: regular expressions
- positivity/negativity: sentiment analysis package
- topic: supervised machine learning
- economic and human-interest frames: supervised machine learning
- topic popularity: part-of-speech tagging, calculation of overlap of nouns in time frame

The final models

negative binomial regression to predict the number of shares

What did we find?

- it's not true that mostly soft topics are shared
- geographical closeness matters
- differences between Facebook and Twitter (e.g., more skewed towards popular stories on FB, more long tail on Twitter)

How do online and offline news differ?

Burggraaff, C., & Trilling, D. (2017). Through a different gate: An automated content analysis of how online news and print news differ. *Journalism, online first*. doi:10.1177/1464884917716699

The data

- Online: as in previous study, but longer time period
- Plus offline articles from a newspaper database

The automated content analysis

- As in previous study, additionally:
- Follow-up news?: cosine similarity
- References to persons: Named entity recognition (NER)
- Entertainment news: supervised machine learning
- Celebrity news: NER + SPARQL-queries on DBpedia (=Wikipedia)

The final models

 regression models that predict the presence of news values (based on among other things online/offline-dummy)

What did we find?

- significant differences between online and offline
- e.g., online more follow-up
- but: no evidence for common perception that online is more entertainment and celebrity news

Take-home message

Take-home message

- There is more than one form of ACA
- top-down (deductive) vs bottom-up (inductive)
- You can start simple!
- No need to use specialized software, it's all available in Python (or R)

Tomorrow

Workshop: A bit of ACA in Python

Damian Trilling
